RDG DJ Dashboard

Executive briefing | Overview, purpose, delivery, and architecture

Riviera Dining Group

OVERVIEW

Host · server · data layer

The application is a static front end hosted on GitHub Pages (no dedicated app server); the browser is the client, and Firebase Realtime Database is the live data / sync layer, with Firebase Storage for files and GitHub Actions supplying scheduled integrations (FourVenues, Toast).

01 WHY

Business purpose

One operating view for guest-DJ nights across Casa Neos Beach Club, MILA, and Casa Neos Lounge — fees, bottle-service vs target, ROI, schedule, and AP — so programming and finance share a single source of truth.

02 HOW

Delivery approach

Built in Cursor as a lightweight HTML/CSS/JS app (no build pipeline). Baseline schedule is in-repo; live edits sync via Firebase. Ship by push to GitHub main; Pages publishes continuously from the IDE workflow.

03 WHERE

Environment & testing

Live test surface: mlavenant.github.io/rdg-dj. Source: MLavenant/rdg-dj (main). Data: Firebase project rdg-dj-dashboard. Integrations refresh on a morning GitHub Actions schedule.

ARCHITECTURE

Top to bottom — from change to live data

BUILD

1 DEVELOPMENT

Cursor IDE · edit HTML / CSS / JS on local PC

Working copy: Documents/rdg-dj-dashboard

↓ push

2 SOURCE CONTROL

Git push → GitHub repository MLavenant/rdg-dj (main)

Code of record for the application

↓ publish

3 HOST (WEB)

GitHub Pages publishes static site · no dedicated application server

https://mlavenant.github.io/rdg-dj/

↓ serve

4 CLIENT

Browser loads the dashboard · Calendar, Accounting, ROI, Forecast

End users interact here (live test environment)

↓ sync

5 DATA LAYER

Firebase Realtime Database (rdg/) + Storage · project: rdg-dj-dashboard

Live edits sync here · everyone sees the same data

↓ ingest

RUNTIME

6 INTEGRATIONS

GitHub Actions (scheduled) → FourVenues events · Toast bottle-service sales

Feeds write into Firebase / Pages on a morning cadence
